A call to arms!

History doesn't give us a clear answer to the question – If the Venus de Milo had been using Falcon™ Troughs, would she still have her arms?

What we do know is that poorly designed arm troughs share several problems. The arm will typically slip out of the trough when the seat is in the full tilt position. The troughs are fragile and break too easily. Adjustability is often limited. Clients resting an arm across the top of the trough often develop a pressure ridge.

Front view of gel arm trough

The Falcon™ trough prevents slippage. The lip is padded to prevent a pressure ridge from forming when the arm is sitting across and not in the trough. The molded plastic shell is impact resistant, increasing its durability.

Angle-in and angle-out adjustments allow the clinician to mirror the arm position. Angle-front and angle-back allow for elevation if the hand or fingers are edematous. Hand pad and hand mount extensions are available. The gel liner is replaceable.

Side view of adjustment bracket

The Gel Arm Trough is compatible with all standard wheel chair arms.

It may not be in a museum but our new trough really IS a work of art.
